

DIVISION FACTS

Fluency set 1

DIVISION FACTS set 7

REMEMBER:
DIVISION IS THE INVERSE OF MULTIPLICATION!

So...

if $5 \times 3 = 15$ then $15 \div 3 = 5$

$$7 \div 7 = 1$$

$$28 \div 7 = 4$$

$$49 \div 7 = 7$$

$$70 \div 7 = 10$$

$$14 \div 7 = 2$$

$$35 \div 7 = 5$$

$$56 \div 7 = 8$$

$$21 \div 7 = 3$$

$$42 \div 7 = 6$$

$$63 \div 7 = 9$$

$$7 \div 7 =$$

$$28 \div 7 =$$

$$14 \div 7 =$$

$$35 \div 7 =$$

$$21 \div 7 =$$

$$42 \div 7 =$$

$$49 \div 7 =$$

$$63 \div 7 =$$

$$56 \div 7 =$$

$$70 \div 7 =$$

Remember division **does not** have a commutative property. The bigger number will always be first when dividing in third grade. You can do $24 \div 4 =$ and get 4 but you **CANNOT** flip it and do $4 \div 24$ to get 4 as your answer.

Remember division is the inverse of multiplication. If you are having a difficult time solving $24 \div 4 = ?$ Then just re-state the problem as $4x = 24$ -> think "what times 4 will give me 24?"
